

A CHARACTERIZATION OF CLASS GROUPS VIA SETS OF LENGTHS II

ALFRED GEROLDINGER AND QINGHAI ZHONG

ABSTRACT. Let H be a Krull monoid with finite class group G and suppose that every class contains a prime divisor. If an element $a \in H$ has a factorization $a = u_1 \cdot \dots \cdot u_k$ into irreducible elements $u_1, \dots, u_k \in H$, then k is called the length of the factorization and the set $\mathsf{L}(a)$ of all possible factorization lengths is the set of lengths of a . It is classical that the system $\mathcal{L}(H) = \{\mathsf{L}(a) \mid a \in H\}$ of all sets of lengths depends only on the class group G , and a standing conjecture states that conversely the system $\mathcal{L}(H)$ is characteristic for the class group. We verify the conjecture if the class group is isomorphic to C_n^r with $r, n \geq 2$ and $r \leq \max\{2, (n+2)/6\}$. Indeed, let H' be a further Krull monoid with class group G' such that every class contains a prime divisor and suppose that $\mathcal{L}(H) = \mathcal{L}(H')$. We prove that, if one of the groups G and G' is isomorphic to C_n^r with r, n as above, then G and G' are isomorphic (apart from two well-known pairings).

1. INTRODUCTION AND MAIN RESULT

Let H be a Krull monoid with class group G and suppose that every class contains a prime divisor (holomorphy rings in global fields are such Krull monoids and more examples will be given in Section 2). Then every nonunit $a \in H$ can be written as a product of irreducible elements, say $a = u_1 \cdot \dots \cdot u_k$, and the number of factors k is called the length of the factorization. The set $\mathsf{L}(a)$ of all possible factorization lengths is the set of lengths of a , and $\mathcal{L}(H) = \{\mathsf{L}(a) \mid a \in H\}$ is called the system of sets of lengths of H (for convenience we set $\mathsf{L}(a) = \{0\}$ if a is an invertible element of H). It is easy to check that all sets of lengths are finite and, by definition of the class group, we observe that H is factorial if and only if $|G| = 1$. By a result due to Carlitz in 1960, we know that H is half-factorial (i.e., $|L| = 1$ for all $L \in \mathcal{L}(H)$) if and only if $|G| \leq 2$.

Suppose that $|G| \geq 3$. Then there is some $a \in H$ with $|\mathsf{L}(a)| > 1$. If $k, \ell \in \mathsf{L}(a)$ with $k < \ell$ and $m \in \mathbb{N}$, then $\mathsf{L}(a^m) \supset \{km + \nu(\ell - k) \mid \nu \in [0, m]\}$ which shows that sets of lengths can become arbitrarily large. The monoid $\mathcal{B}(G)$ of zero-sum sequences over G is again a Krull monoid with class group isomorphic to G , every class contains a prime divisor, and the systems of sets of lengths of H and that of $\mathcal{B}(G)$ coincide. Thus $\mathcal{L}(H) = \mathcal{L}(\mathcal{B}(G))$, and it is usual to set $\mathcal{L}(G) := \mathcal{L}(\mathcal{B}(G))$. In particular, the system of sets of lengths of H depends only on the class group G . The associated inverse question asks whether or not sets of lengths are characteristic for the class group. More precisely, the Characterization Problem for class groups can be formulated as follows (see [8, Section 7.3], [11, page 42], [22], and Proposition 2.1)).

Given two finite abelian groups G and G' such that $\mathcal{L}(G) = \mathcal{L}(G')$. Does it follow that $G \cong G'$?

The system of sets of lengths $\mathcal{L}(G)$ is studied with methods from additive combinatorics. In particular, zero-sum theoretical invariants (such as the Davenport constant or the cross number) and the associated inverse problems play a crucial role. Most of these invariants are well-understood only in a very limited number of cases (e.g., for groups of rank two, the precise value of the Davenport constant $D(G)$ is known and the associated inverse problem is solved; however, if n is not a prime power and $r \geq 3$, then the value

Key words and phrases. Krull monoids, maximal orders, seminormal orders; class groups, arithmetical characterizations, sets of lengths, zero-sum sequences, Davenport constant.

This work was supported by the Austrian Science Fund FWF, Project Number M1641-N26.

of the Davenport constant $D(C_n^r)$ is unknown). Thus it is not surprising that affirmative answers to the Characterization Problem so far have been restricted to those groups where we have a good understanding of the Davenport constant. These groups include elementary 2-groups, cyclic groups, and groups of rank two (the latter were recently handled in [13]; for a variety of partial results we refer to [20, 23, 21]).

The goal of the present note is to solve the Characterization Problem for groups of the form C_n^r if the exponent is large with respect to the rank. Here is our main theorem.

Theorem 1.1. *Let G be an abelian group such that $\mathcal{L}(G) = \mathcal{L}(C_n^r)$ where $r, n \in \mathbb{N}$ with $n \geq 2$, $(n, r) \notin \{(2, 1), (2, 2), (3, 1)\}$, and $r \leq \max\{2, (n + 2)/6\}$. Then $G \cong C_n^r$.*

The groups C_n^r , where r, n are as above, are the first groups at all for which the Characterization Problem is solved whereas the Davenport constant is unknown. This is made possible by a detailed study of the set of minimal distances $\Delta^*(G) = \{\min \Delta(G_0) \mid G_0 \subset G \text{ is a non-half-factorial subset}\}$ and the associated minimal non-half-factorial subsets. Sets of minimal distances have been investigated by Chapman, Gryniewicz, Hamidoune, Plagne, Schmid, Smith, and others (see [8, Section 6.8] for some basic information and [9, 19, 5, 21, 3, 15, 18] for recent progress). In Section 2 we repeat some key facts on Krull monoids and gather the required machinery, and in Section 3 we study structural properties of (large) minimal non-half-factorial sets. The proof of Theorem 1.1 will be provided in Section 4 where we also give a positive answer to the Characterization Problem for all groups G with Davenport constant $D(G) \in [4, 11]$ (Proposition 4.1).

2. BACKGROUND ON KRULL MONOIDS AND THEIR SETS OF MINIMAL DISTANCES

Our notation and terminology are consistent with [12]. We denote by \mathbb{N} the set of positive integers, and for $a, b \in \mathbb{Q}$, we denote by $[a, b] = \{x \in \mathbb{Z} \mid a \leq x \leq b\}$ the discrete, finite interval between a and b . If $A, B \subset \mathbb{Z}$ are subsets of the integers, then $A + B = \{a + b \mid a \in A, b \in B\}$ denotes their *sumset*, and $\Delta(A)$ the *set of (successive) distances* of A (that is, $d \in \Delta(A)$ if and only if $d = b - a$ with $a, b \in A$ distinct and $[a, b] \cap A = \{a, b\}$). Let $d, l \in \mathbb{N}$ and $M \in \mathbb{N}_0$. A subset $L \subset \mathbb{Z}$ is called an *almost arithmetical progression* (AAP for short) with *difference* d , *length* l , and *bound* M if

$$L = y + (L' \cup L^* \cup L'') \subset y + d\mathbb{Z},$$

where $y \in \mathbb{Z}$, $L^* = \{\nu d \mid \nu \in [0, l]\}$ is an arithmetical progression with difference d and length l , $L' \subset [-M, -1]$, and $L'' \subset \max L^* + [1, M]$.

By a monoid we mean a commutative semigroup with identity which satisfies the cancellation laws. A monoid F is called free abelian with basis $P \subset F$, and we write $F = \mathcal{F}(P)$, if every $a \in F$ has a unique representation of the form

$$a = \prod_{p \in P} p^{v_p(a)} \quad \text{with} \quad v_p(a) \in \mathbb{N}_0 \quad \text{and} \quad v_p(a) = 0 \quad \text{for almost all } p \in P.$$

A monoid H is said to be a *Krull monoid* if it satisfies one of the following two equivalent conditions (see [8, Theorem 2.4.8]).

- (a) H is *v-noetherian* and completely integrally closed.
- (b) There exists a monoid homomorphism $\varphi: H \rightarrow F = \mathcal{F}(P)$ into a free abelian monoid F such that $a \mid b$ in H if and only if $\varphi(a) \mid \varphi(b)$ in F .

Rings of integers, holomorphy rings in algebraic function fields, and regular congruence monoids in these domains are Krull monoids with finite class group such that every class contains a prime divisor ([8, Section 2.11 and Examples 7.4.2]). Monoid domains and power series domains that are Krull are discussed in [17, 4], and note that every class of a Krull monoid domain contains a prime divisor. For monoids of modules that are Krull and their distribution of prime divisors, we refer the reader to [6, 1].

Sets of lengths in Krull monoids can be studied in the monoid of zero-sum sequences over its class group. Let G be an additively written abelian group and $G_0 \subset G$ a subset. An element

$$S = g_1 \cdot \dots \cdot g_\ell = \prod_{g \in G_0} g^{v_g(S)} \in \mathcal{F}(G_0)$$

is called a sequence over G_0 , and we use all notations as in [16]. In particular, $\sigma(S) = g_1 + \dots + g_\ell$ denotes the sum, $|S| = \ell$ the length, $\mathbf{h}(S) = \max\{v_g(S) \mid g \in G_0\}$ the maximal multiplicity, $\text{supp}(S) = \{g_1, \dots, g_\ell\} \subset G_0$ the support, and $\mathbf{k}(S) = \sum_{i=1}^\ell 1/\text{ord}(g_i)$ the cross number of S . The monoid

$$\mathcal{B}(G_0) = \{S \in \mathcal{F}(G_0) \mid \sigma(S) = 0\}$$

is the monoid of zero-sum sequences over G_0 , and since the embedding $\mathcal{B}(G_0) \hookrightarrow \mathcal{F}(G_0)$ satisfies Condition (b) above, $\mathcal{B}(G_0)$ is a Krull monoid. As usual, we write $\mathcal{L}(G_0) = \mathcal{L}(\mathcal{B}(G_0))$ for the system of sets of lengths of $\mathcal{B}(G_0)$ and $\mathcal{A}(G_0) = \mathcal{A}(\mathcal{B}(G_0))$ for the set of atoms (the set of irreducible elements) of $\mathcal{B}(G_0)$. Note that the atoms of $\mathcal{B}(G_0)$ are precisely the minimal zero-sum sequences over G_0 , and

$$\mathbf{D}(G_0) = \sup\{|U| \mid U \in \mathcal{A}(G_0)\} \in \mathbb{N} \cup \{\infty\}$$

is the *Davenport constant* of G_0 . The significance of the system of sets of lengths $\mathcal{L}(G)$ (and hence of the Characterization Problem in the formulation given in the Introduction) stems from its universal role which can be seen from the following proposition.

Proposition 2.1.

1. If H is a Krull monoid with class group G such that each class contains a prime divisor, then $\mathcal{L}(H) = \mathcal{L}(G)$.
2. Let \mathcal{O} be a holomorphy ring in a global field K , A a central simple algebra over K , and H a classical maximal \mathcal{O} -order of A such that every stably free left R -ideal is free. Then $\mathcal{L}(H) = \mathcal{L}(G)$, where G is a ray class group of \mathcal{O} and hence finite abelian.
3. Let H be a seminormal order in a holomorphy ring of a global field with principal order \widehat{H} such that the natural map $\mathfrak{X}(\widehat{H}) \rightarrow \mathfrak{X}(H)$ is bijective and there is an isomorphism $\overline{\vartheta}: \mathcal{C}_v(H) \rightarrow \mathcal{C}_v(\widehat{H})$ between the v -class groups. Then $\mathcal{L}(H) = \mathcal{L}(G)$, where $G = \mathcal{C}_v(H)$ is finite abelian.

Proof. 1. See [8, Section 3.4].

2. See [24, Theorem 1.1], and [2] for related results of this flavor.

3. See [10, Theorem 5.8] for a more general result in the setting of weakly Krull monoids. \square

Next we discuss sets of distances and minimal sets of distances. Let

$$\Delta(G_0) = \bigcup_{L \in \mathcal{L}(G_0)} \Delta(L) \subset \mathbb{N}$$

denote the *set of distances* of G_0 . Then G_0 is called half-factorial if $\Delta(G_0) = \emptyset$. Otherwise, G_0 is called non-half-factorial and we have $\min \Delta(G_0) = \gcd \Delta(G_0)$. Note that G_0 is half-factorial if and only if $\mathbf{k}(A) = 1$ for all $A \in \mathcal{A}(G_0)$. Furthermore, the set G_0 is called

- minimal non-half-factorial if it is half-factorial and every proper subset $G_1 \subsetneq G_0$ is half-factorial.
- an LCN-set if $\mathbf{k}(A) \geq 1$ for all $A \in \mathcal{A}(G_0)$.

The set $\Delta(G)$ is an interval and its maximum is studied in [7]. The following two subsets of $\Delta(G)$, the *set of minimal distances* $\Delta^*(G)$ and the set $\Delta_1(G)$, play a crucial role in the present paper. We define

$$\begin{aligned} \Delta^*(G) &= \{\min \Delta(G_0) \mid G_0 \subset G \text{ with } \Delta(G_0) \neq \emptyset\} \subset \Delta(G), \\ \mathbf{m}(G) &= \max\{\min \Delta(G_0) \mid G_0 \subset G \text{ is an LCN-set with } \Delta(G_0) \neq \emptyset\}, \end{aligned}$$

and we denote by $\Delta_1(G)$ the set of all $d \in \mathbb{N}$ with the following property:

For every $k \in \mathbb{N}$, there exists some $L \in \mathcal{L}(G)$ which is an AAP with difference d and length $l \geq k$.

Thus, by definition, if G' is a further finite abelian group such that $\mathcal{L}(G) = \mathcal{L}(G')$, then $\Delta_1(G) = \Delta_1(G')$. The next proposition gathers the properties of $\Delta^*(G)$ and of $\Delta_1(G)$ which are needed in the sequel.

Proposition 2.2. *Let G be a finite abelian group with $|G| \geq 3$ and $\exp(G) = n$.*

1. $\Delta^*(G) \subset \Delta_1(G) \subset \{d_1 \in \Delta(G) \mid d_1 \text{ divides some } d \in \Delta^*(G)\}$. In particular, $\max \Delta^*(G) = \max \Delta_1(G)$.
2. $\max \Delta^*(G) = \max\{\exp(G) - 2, \mathfrak{m}(G)\} = \max\{\exp(G) - 2, \mathfrak{r}(G) - 1\}$. If G is a p -group, then $\mathfrak{m}(G) = \mathfrak{r}(G) - 1$.
3. If $k \in \mathbb{N}$ is maximal such that G has a subgroup isomorphic to C_n^k , then

$$\Delta_1(G) \subset [1, \max\{\mathfrak{m}(G), \lfloor \frac{n}{2} \rfloor - 1\}] \cup [\max\{1, n - k - 1\}, n - 2].$$

and

$$[1, \mathfrak{r}(G) - 1] \cup [\max\{1, n - k - 1\}, n - 2] \subset \Delta_1(G).$$

Proof. 1. follows from [8, Corollary 4.3.16] and 2. from [15, Theorem 1.1 and Proposition 3.2].

3. In [21, Theorem 3.2], it is proved that $\Delta^*(G)$ is contained in the set given above. Since this set contains all its divisors, $\Delta_1(G)$ is contained in it by 1. The set $[1, \mathfrak{r}(G) - 1] \cup [\max\{1, n - k - 1\}, n - 2]$ is contained in $\Delta_1(G)$ by [8, Propositions 4.1.2 and 6.8.2]. \square

3. MINIMAL NON-HALF-FACTORIAL SUBSETS

Throughout this section, let G be an additive finite abelian group with $|G| \geq 3$, $\exp(G) = n$, and $\mathfrak{r}(G) = r$.

The following two technical lemmas will be used throughout the manuscript.

Lemma 3.1. *Let $G_0 \subset G$ a subset.*

1. For each $g \in G_0$,

$$\begin{aligned} \gcd(\{\mathfrak{v}_g(B) \mid B \in \mathcal{B}(G_0)\}) &= \gcd(\{\mathfrak{v}_g(A) \mid A \in \mathcal{A}(G_0)\}) \\ &= \min(\{\mathfrak{v}_g(A) \mid \mathfrak{v}_g(A) > 0, A \in \mathcal{A}(G_0)\}) = \min(\{\mathfrak{v}_g(B) \mid \mathfrak{v}_g(B) > 0, B \in \mathcal{B}(G_0)\}) \\ &= \min(\{k \in \mathbb{N} \mid kg \in \langle G_0 \setminus \{g\} \rangle\}) = \gcd(\{k \in \mathbb{N} \mid kg \in \langle G_0 \setminus \{g\} \rangle\}). \end{aligned}$$

In particular, $\min(\{k \in \mathbb{N} \mid kg \in \langle G_0 \setminus \{g\} \rangle\})$ divides $\text{ord}(g)$.

2. Suppose that for any $h \in G_0$, we have that $h \notin \langle G_0 \setminus \{h, h'\} \rangle$ for any $h' \in G_0 \setminus \{h\}$. Then for any atom A with $\text{supp}(A) \subsetneq G_0$ and any $h \in \text{supp}(A)$, we have $\gcd(\mathfrak{v}_h(A), \text{ord}(h)) > 1$.
3. If G_0 is minimal non-half-factorial, then there exists a minimal non-half-factorial subset $G_0^* \subset G$ with $|G_0| = |G_0^*|$ and a transfer homomorphism $\theta: \mathcal{B}(G_0) \rightarrow \mathcal{B}(G_0^*)$ such that the following properties are satisfied:
 - (a) For each $g \in G_0^*$, we have $g \in \langle G_0^* \setminus \{g\} \rangle$.
 - (b) For each $B \in \mathcal{B}(G_0)$, we have $\mathfrak{k}(B) = \mathfrak{k}(\theta(B))$.
 - (c) If G_0^* has the property that for each $h \in G_0^*$, $h \notin \langle E \rangle$ for any $E \subsetneq G_0^* \setminus \{h\}$, then G_0 also has the property.

Proof. See [15, Lemma 3.4]. \square

Lemma 3.2.

1. If $g \in G$ with $\text{ord}(g) \geq 3$, then $\text{ord}(g) - 2 \in \Delta^*(G)$. In particular, $n - 2 \in \Delta^*(G)$.
2. If $r \geq 2$, then $[1, r - 1] \subset \Delta^*(G)$.

3. Let $G_0 \subset G$ a subset.

(a) If there exists an $U \in \mathcal{A}(G_0)$ with $k(U) < 1$, then $\min \Delta(G_0) \leq \exp(G) - 2$.

(b) If G_0 is an LCN-set, then $\min \Delta(G_0) \leq |G_0| - 2$.

Proof. See [8, Proposition 6.8.2 and Lemmas 6.8.5 and 6.8.6]. \square

Lemma 3.3. Let $G_0 \subset G$ be a subset, $g \in G_0$, and s the smallest integer such that $sg \in \langle G_0 \setminus \{g\} \rangle$, and suppose that $s < \text{ord}(g)$. Then $\text{ord}(sg) > 1$ and for each prime p dividing $\text{ord}(sg)$, there exists an atom $A \in \mathcal{A}(G_0)$ with $2 \leq |\text{supp}(A)| \leq r(G) + 1$, $s \leq v_g(A) \leq \text{ord}(g)/2$, and $p \nmid \frac{v_g(A)}{s}$. In particular,

1. If $|G_0| \geq r(G) + 2$, then there exist $s_0 < \text{ord}(g)$ and $E \subsetneq G_0 \setminus \{g\}$ such that $s_0 g \in \langle E \rangle$.
2. If $s = 1$ and $\text{ord}(g)$ is a prime power, then there exists a subset $E \subset G_0 \setminus \{g\}$ with $|E| \leq r(G)$ such that $g \in \langle E \rangle$.

Proof. We set $\exp(G) = n = p_1^{k_1} \cdots p_t^{k_t}$, where $t, k_1, \dots, k_t \in \mathbb{N}$ and p_1, \dots, p_t are distinct primes. Since $s < \text{ord}(g)$, we have that $\text{ord}(sg) > 1$. Let $\nu \in [1, t]$ with $p_\nu \mid \text{ord}(sg)$. Since $sg \in \langle G_0 \setminus \{g\} \rangle$, it follows that $0 \neq \frac{n}{p_\nu^{k_\nu}} sg \in G_\nu = \langle \frac{n}{p_\nu^{k_\nu}} h \mid h \in G_0 \setminus \{g\} \rangle$. Obviously, G_ν is a p_ν -group. Let $E_\nu \subset G_0 \setminus \{g\}$ be minimal such that $\frac{n}{p_\nu^{k_\nu}} sg \in \langle \frac{n}{p_\nu^{k_\nu}} E_\nu \rangle$. Since $\langle \frac{n}{p_\nu^{k_\nu}} E_\nu \rangle \subset G_\nu$ and G_ν is a p_ν -group, it follows that

$$1 \leq |E_\nu| = |\frac{n}{p_\nu^{k_\nu}} E_\nu| \leq r(G_\nu) \leq r(G).$$

Let $d_\nu \in \mathbb{N}$ be minimal such that $d_\nu g \in \langle E_\nu \rangle$. Since $0 \neq \frac{n}{p_\nu^{k_\nu}} sg \in \langle E_\nu \rangle$, it follows that $d_\nu < \text{ord}(g)$. By Lemma 3.1.1, $d_\nu \mid \gcd(\frac{n}{p_\nu^{k_\nu}} s, \text{ord}(g))$ and there exists an atom U_ν such that $v_g(U_\nu) = d_\nu$ and $|\text{supp}(U_\nu) \setminus \{g\}| \leq |E_\nu| \leq r(G)$. Since $v_g(U_\nu) = d_\nu < \text{ord}(g)$, it follows that $|\text{supp}(U_\nu)| \geq 2$. By the minimality of s and $d_\nu \mid \frac{n}{p_\nu^{k_\nu}} s$, we have that $s \mid d_\nu$ and $p_\nu \nmid \frac{d_\nu}{s}$.

If $|G_0| \geq r(G) + 2$, then $|E_\nu| \leq r(G) < |G_0 \setminus \{g\}|$ implies that $E_\nu \subsetneq G_0 \setminus \{g\}$, and the assertion holds with $E = E_\nu$ and $s_0 = d_\nu$.

If $s = 1$ and $\text{ord}(g)$ is a prime power, then $\text{ord}(g)$ is a power of p_ν which implies that $\gcd(\frac{n}{p_\nu^{k_\nu}} s, \text{ord}(g)) = 1$ whence $d_\nu = 1$ and $g \in \langle E_\nu \rangle$. \square

Lemma 3.4. Let $G_0 \subset G$ be a minimal non-half-factorial LCN-set with $|G_0| \geq r + 2$. Suppose that for any $h \in G_0$, $h \in \langle G_0 \setminus \{h\} \rangle$ but $h \notin \langle G_0 \setminus \{h, h'\} \rangle$ for any $h' \in G_0 \setminus \{h\}$. Then $|G_0| \leq r + \frac{n}{2}$. In particular, if each atom $A \in \mathcal{A}(G_0)$ with $\text{supp}(A) = G_0$ has cross number $k(A) > 1$, then $\min \Delta(G_0) \leq \frac{5n}{6} - 4$.

Proof. We choose an element $g \in G_0$. If $\text{ord}(g)$ is a prime power, then there exists $E \subset G_0 \setminus \{g\}$ such that $g \in \langle E \rangle$ and $|E| \leq r < |G_0| - 1$ by Lemma 3.3, a contradiction to the assumption on G_0 . Thus $\text{ord}(g)$ is not a prime power.

Let $s \in \mathbb{N}$ be minimal such that there exists a subset $E \subsetneq G_0 \setminus \{g\}$ with $sg \in \langle E \rangle$, and by Lemma 3.3.1, we observe that $s < \text{ord}(g)$. Let $E \subsetneq G_0 \setminus \{g\}$ be minimal such that $sg \in \langle E \rangle$. By Lemma 3.1.1, there is an atom V with $v_g(V) = s \mid \text{ord}(g)$ and $\text{supp}(V) = \{g\} \cup E \subsetneq G_0$. By Lemma 3.1.2, for each $h \in \text{supp}(V)$, $v_h(V) \geq 2$. Since G_0 is a minimal non-half-factorial LCN set, we obtain that

$$1 = k(V) \geq \frac{2}{n}(|E| + 1),$$

whence $|E| \leq \frac{n}{2} - 1$.

Since $s \geq 2$, there is a prime $p \in \mathbb{N}$ dividing s and hence $p \mid s \mid \text{ord}(g)$. By Lemma 3.3, there exists an atom U_1 such that $|\text{supp}(U_1)| \leq r + 1$ and $p \nmid v_g(U_1)$, and therefore $\text{supp}(U_1) \subsetneq G_0$.

Let $d = \gcd(s, v_g(U_1))$ and $E_1 = \text{supp}(U_1) \setminus \{g\}$. Then $d < s$ and $dg \in \langle sg, v_g(U_1)g \rangle \subset \langle E \cup E_1 \rangle \subset \langle G_0 \setminus \{g\} \rangle$. The minimality of s implies that $E \cup E_1 = G_0 \setminus \{g\}$, and thus $|G_0| \leq 1 + |E| + |E_1| \leq 1 + r + \frac{n}{2} - 1 = r + \frac{n}{2}$.

Suppose that each atom $A \in \mathcal{A}(G_0)$ with $\text{supp}(A) = G_0$ has cross number $k(A) > 1$. There exist $x_1 \in [1, \frac{\text{ord}(g)}{s} - 1]$ and $x_2 \in [1, \frac{\text{ord}(g)}{v_g(U_1)} - 1]$ such that $dg = x_1 sg + x_2 v_g(U_1)g$. Thus $d + y \text{ord}(g) = x_1 s + x_2 v_g(U_1)$ with some $y \in \mathbb{N}_0$. Let $V^{x_1} U_1^{x_2} = (g^{\text{ord}(g)})^y \cdot W$, where $W \in \mathcal{B}(G)$ with $v_g(W) = d$, and let W_1 be an atom dividing W with $v_g(W_1) > 0$. Since $v_g(W_1) \leq d < s$, the minimality of s implies that $\text{supp}(W_1) = G_0$ and hence $k(W_1) > 1$. Since G_0 is minimal non-half-factorial, we have that $k(V) = k(U_1) = 1$. Therefore there exists $l \in \mathbb{N}$ with $2 \leq l < x_1 + x_2$ such that $\{l, x_1 + x_2\} \subset \mathcal{L}(V^{x_1} U_1^{x_2})$. Then

$$\min \Delta(G_0) \leq x_1 + x_2 - l \leq \frac{\text{ord}(g)}{s} + \frac{\text{ord}(g)}{v_g(U_1)} - 4 \leq \frac{5n}{6} - 4. \quad \square$$

For our next result we need the following technical lemma

Lemma 3.5. *Let $G_0 \subset G$ be a non-half-factorial subset satisfying the following two conditions:*

- (a) *There exists some $g \in G_0$ such that $\Delta(G_0 \setminus \{g\}) = \emptyset$.*
- (b) *There exists some $U \in \mathcal{A}(G_0)$ with $k(U) = 1$ and $\gcd(v_g(U), \text{ord}(g)) = 1$.*

Then $k(\mathcal{A}(G_0)) \subset \mathbb{N}$ and

$$\min \Delta(G_0) \mid \gcd\{k(A) - 1 \mid A \in \mathcal{A}(G_0)\}.$$

Note that the conditions hold if $\Delta(G_1) = \emptyset$ for each $G_1 \subsetneq G_0$ and there exists some G_2 such that $\langle G_2 \rangle = \langle G_0 \rangle$ and $|G_2| \leq |G_0| - 2$.

Proof. The first statement follows from [8, Lemma 6.8.5]. If $\Delta(G_1) = \emptyset$ for all $G_1 \subsetneq G_0$, then Condition (a) holds. Let $G_2 \subsetneq G_1 \subsetneq G_0$ with $\langle G_2 \rangle = \langle G_0 \rangle$. If $g \in G_1 \setminus G_2$, then $\langle G_2 \rangle = \langle G_0 \rangle$ implies that there is some $U \in \mathcal{A}(G_1)$ with $v_g(U) = 1$, and since $G_1 \subsetneq G_0$, it follows that $k(U) = 1$. \square

Lemma 3.6. *Suppose that $\exp(G) = n$ is not a prime power. Let $G_0 \subset G$ be a minimal non-half-factorial LCN-set with $|G_0| \geq r + 2$ such that $h \in \langle G_0 \setminus \{h\} \rangle$ for every $h \in G_0$. Suppose that one of the following properties is satisfied:*

- (a) *For any $h \in G_0$, $h \notin \langle G_0 \setminus \{h, h'\} \rangle$ for any $h' \in G_0 \setminus \{h\}$ and there exists an atom $A \in \mathcal{A}(G_0)$ with $k(A) = 1$ and $\text{supp}(A) = G_0$.*
- (b) *There is a subset $G_2 \subset G_0$ such that $\langle G_2 \rangle = \langle G_0 \rangle$ and $|G_2| \leq |G_0| - 2$.*

Then $\min \Delta(G_0) \leq \frac{n+r-3}{2}$.

Proof. Assume to the contrary that $\min \Delta(G_0) \geq \frac{n+r}{2} - 1$. Then Lemma 3.2.3.(b) implies that $|G_0| \geq \frac{n+r}{2} + 1$. If Property (a) is satisfied, then Lemma 3.1.2 implies that there exists some $g \in G_0$ such that $v_g(A) = 1$. By Lemma 3.5, each of the two Properties (a) and (b) implies that $k(U) \in \mathbb{N}$ for each $U \in \mathcal{A}(G_0)$ and

$$\min \Delta(G_0) \mid \gcd(\{k(U) - 1 \mid U \in \mathcal{A}(G_0)\}).$$

We set

$$\Omega_{=1} = \{A \in \mathcal{A}(G_0) \mid k(A) = 1\} \quad \text{and} \quad \Omega_{>1} = \{A \in \mathcal{A}(G_0) \mid k(A) > 1\}.$$

Thus for each $U_1, U_2 \in \Omega_{>1}$ we have

$$(3.1) \quad k(U_1) \geq \frac{n+r}{2} \quad \text{and} \quad (\text{either } k(U_1) = k(U_2) \text{ or } |k(U_1) - k(U_2)| \geq \frac{n+r}{2} - 1).$$

Furthermore, for each $U \in \Omega_{=1}$ we have $h(U) \geq 2$ (otherwise, U would divide every atom $U_1 \in \Omega_{>1}$). We claim that

A1. For each $U \in \Omega_{>1}$, there are $A_1, \dots, A_m \in \Omega_{=1}$, where $m \leq \frac{n+1}{2}$, such that $UA_1 \cdots A_m$ can be factorized into a product of atoms from $\Omega_{=1}$.

Proof of A1. Suppose that Property (a) holds. As observed above there exists some $g \in G_0$ such that $v_g(A) = 1$. Lemma 3.3 implies that there is an atom X such that $2 \leq |\text{supp}(X)| \leq r(G) + 1$ and $1 \leq v_g(X) \leq \text{ord}(g)/2$. Since $g \notin \langle G_0 \setminus \{g, h\} \rangle$ for any $h \in G_0 \setminus \{g\}$, it follows that $v_g(X) \geq 2$, and $|G_0| \geq r + 2$ implies $\text{supp}(X) \subsetneq G_0$.

Suppose that Property (b) is satisfied. We choose an element $g \in G_0 \setminus G_2$. Then $g \in \langle G_2 \rangle$ and by Lemma 3.1.1, there is an atom A' with $v_g(A') = 1$ and $\text{supp}(A') \subset G_2 \cup \{g\} \subsetneq G_0$. This implies that $A' \in \Omega_{=1}$. Let $h \in G_0$ such that $v_h(A') = h(A')$. Since $h(A') \geq 2$, we obtain that $A'^{\lceil \frac{\text{ord}(h)}{h(A')} \rceil} = h^{\text{ord}(h)} \cdot W$ where W is a product of $\lceil \frac{\text{ord}(h)}{h(A')} \rceil - 1$ atoms and $v_g(W) = \lceil \frac{\text{ord}(h)}{h(A')} \rceil$. Thus there exists an atom X' with $2 \leq v_g(X') \leq \lceil \frac{\text{ord}(h)}{h(A')} \rceil \leq \frac{n}{2} + 1$.

Therefore both properties imply that there are $A, X \in \mathcal{A}(G_0)$ and $g \in G_0$ such that $k(A) = k(X) = 1$, $v_g(A) = 1$, and $2 \leq v_g(X) \leq \frac{n}{2} + 1$. Let $U \in \Omega_{>1}$.

If $\text{ord}(g) - v_g(U) < v_g(X) \leq \frac{n}{2} + 1$, then

$$UA^{\text{ord}(g) - v_g(U)} = g^{\text{ord}(g)} S,$$

where $S \in \mathcal{B}(G_0)$ and $\text{ord}(g) - v_g(U) \leq \frac{n}{2}$. Since $\text{supp}(S) \subsetneq G_0$, S is a product of atoms from $\Omega_{=1}$.

If $\text{ord}(g) - v_g(U) \geq v_g(X)$, then

$$UX^{\lfloor \frac{\text{ord}(g) - v_g(U)}{v_g(X)} \rfloor} A^{\text{ord}(g) - v_g(U) - v_g(X) \cdot \lfloor \frac{\text{ord}(g) - v_g(U)}{v_g(X)} \rfloor} = g^{\text{ord}(g)} S,$$

where S is a product of atoms from $\Omega_{=1}$ (because $\text{supp}(S) \subsetneq G_0$) and

$$\begin{aligned} & \left\lfloor \frac{\text{ord}(g) - v_g(U)}{v_g(X)} \right\rfloor + \text{ord}(g) - v_g(U) - v_g(X) \cdot \left\lfloor \frac{\text{ord}(g) - v_g(U)}{v_g(X)} \right\rfloor \\ & \leq \frac{(\text{ord}(g) - v_g(U)) - (v_g(X) - 1)}{v_g(X)} + v_g(X) - 1 \\ & \leq \frac{\text{ord}(g) - v_g(U) + 1}{2} \leq \frac{n + 1}{2}. \end{aligned} \quad \square(\text{Proof of A1})$$

We set

$$\Omega'_{>1} = \{A \in \mathcal{A}(G_0) \mid k(A) = \min\{k(B) \mid B \in \Omega_{>1}\}\} \subset \Omega_{>1},$$

and we consider all tuples (U, A_1, \dots, A_m) , where $U \in \Omega'_{>1}$ and $A_1, \dots, A_m \in \Omega_{=1}$, such that $UA_1 \dots A_m$ can be factorized into a product of atoms from $\Omega_{=1}$. We fix one such tuple (U, A_1, \dots, A_m) with the property that m is minimal possible. Let

$$(3.2) \quad UA_1 \dots A_m = V_1 \dots V_t \quad \text{with} \quad t \in \mathbb{N} \quad \text{and} \quad V_1, \dots, V_t \in \Omega_{=1}.$$

We observe that $k(U) = t - m$ and continue with the following assertion.

A2. For each $\nu \in [1, t]$, we have $V_\nu \nmid UA_1 \dots A_{m-1}$.

Proof of A2. Assume to the contrary that there is such a $\nu \in [1, t]$, say $\nu = 1$, with $V_1 \mid UA_1 \dots A_{m-1}$. Then there are $l \in \mathbb{N}$ and $T_1, \dots, T_l \in \mathcal{A}(G_0)$ such that

$$UA_1 \dots A_{m-1} = V_1 T_1 \dots T_l.$$

By the minimality of m , there exists some $\nu \in [1, l]$ such that $T_\nu \in \Omega_{>1}$, say $\nu = 1$. Since

$$\sum_{\nu=2}^l k(T_\nu) = k(U) + (m-1) - 1 - k(T_1) \leq m-2 \leq \frac{n-3}{2},$$

and $k(T') \geq \frac{r+n}{2}$ for all $T' \in \Omega_{>1}$, it follows that $T_2, \dots, T_l \in \Omega_{=1}$, whence $l = 1 + \sum_{\nu=2}^l k(T_\nu) \leq m-1$. We obtain that

$$V_1 T_1 \dots T_l A_m = UA_1 \dots A_m = V_1 \dots V_t,$$

and thus

$$T_1 \cdot \dots \cdot T_l A_m = V_2 \cdot \dots \cdot V_t.$$

The minimality of m implies that $k(T_1) > k(U)$. It follows that

$$k(T_1) - k(U) = m - 1 - l \leq m - 2 \leq \frac{n-3}{2} < \frac{r+n}{2} - 1 \leq k(T_1) - k(U),$$

a contradiction. \square (Proof of **A2**)

By Equation (3.2), there are $X_1, Y_1, \dots, X_t, Y_t \in \mathcal{F}(G)$ such that

$$UA_1 \cdot \dots \cdot A_{m-1} = X_1 \cdot \dots \cdot X_t, \quad A_m = Y_1 \cdot \dots \cdot Y_t, \quad \text{and } V_i = X_i Y_i \text{ for each } i \in [1, t].$$

Then **A2** implies that $|Y_i| \geq 1$ for each $i \in [1, t]$, and we set $\alpha = |\{i \in [1, t] \mid |Y_i| = 1\}|$. If $\alpha \leq m + r$, then

$$n \geq |A_m| = |Y_1| + \dots + |Y_t| \geq \alpha + 2(t - \alpha) = 2t - \alpha \geq 2t - m - r,$$

and hence $\min \Delta(G_0) \leq t - 1 - m \leq \frac{r+n-3}{2}$, a contradiction. Thus $\alpha \geq m + r + 1$. After renumbering if necessary we assume that $1 = |Y_1| = \dots = |Y_\alpha| < |Y_{\alpha+1}| \leq \dots \leq |Y_t|$. Let $Y_i = y_i$ for each $i \in [1, \alpha]$ and

$$(3.3) \quad S_0 = \{y_1, y_2, \dots, y_\alpha\}.$$

For every $i \in [1, \alpha]$, $V_i \mid y_i UA_1 \cdot \dots \cdot A_{m-1}$ whence $v_{y_i}(V_i) \leq 1 + v_{y_i}(UA_1 \cdot \dots \cdot A_{m-1})$ and since $V_i \nmid UA_1 \cdot \dots \cdot A_{m-1}$, it follows that

$$(3.4) \quad v_{y_i}(V_i) = v_{y_i}(UA_1 \cdot \dots \cdot A_{m-1}) + 1.$$

Assume to the contrary that there are distinct $i, j \in [1, \alpha]$ such that $y_i = y_j$. Then

$$v_{y_i}(UA_1 \cdot \dots \cdot A_{m-1}) + 1 = v_{y_i}(V_i) = v_{y_i}(X_i) + 1 = v_{y_i}(V_j) = v_{y_i}(X_j) + 1.$$

Since $X_i X_j \mid UA_1 \cdot \dots \cdot A_{m-1}$, we infer that

$$v_{y_i}(UA_1 \cdot \dots \cdot A_{m-1}) \geq v_{y_i}(X_i X_j) = v_{y_i}(V_i V_j) - 2 = 2v_{y_i}(UA_1 \cdot \dots \cdot A_{m-1}),$$

which implies that $v_{y_i}(UA_1 \cdot \dots \cdot A_{m-1}) = 0$, a contradiction to $\text{supp}(U) = G_0$. Thus $|S_0| = \alpha$ and

$$(3.5) \quad |\text{supp}(A_m)| \geq |S_0| = \alpha \geq m + r + 1.$$

We proceed by the following two assertions.

A3. There exist $g' \in G_0$ and $A' \in \mathcal{A}(G_0)$ with $k(A') = 1$ satisfying the following three conditions:

- (C1) $v_{g'}(A') < \text{ord}(g')$ is the smallest positive integer γ such that $\gamma g' \in \langle \text{supp}(A') \setminus \{g'\} \rangle$;
- (C2) $v_{g'}(A')g' \notin \langle E \rangle$ for any $E \subsetneq \text{supp}(A') \setminus \{g'\}$.
- (C3) $UA_1 \cdot \dots \cdot A_{m-1} \cdot A'$ can be factorized into a product of atoms from $\Omega_{=1}$.

Proof of A3. Suppose that Property (a) is satisfied. As observed at the beginning of the proof, there is a $g \in G_0$ such that $v_g(A) = 1$. We choose $A' = A$ and $g' = g$, and we need to prove that $UA_1 \cdot \dots \cdot A_{m-1} \cdot A$ can be factorized into a product of atoms from $\Omega_{=1}$. Since $S_0 \subset \text{supp}(A) = G_0$, then $V_1 \cdot \dots \cdot V_\alpha \mid UA_1 \cdot \dots \cdot A_{m-1} \cdot A$ and hence $k(UA_1 \cdot \dots \cdot A_{m-1} \cdot A(V_1 \cdot \dots \cdot V_\alpha)^{-1}) < k(U)$. The minimality of $k(U)$ implies that $UA_1 \cdot \dots \cdot A_{m-1} \cdot A$ can be factorized into a product of atoms from $\Omega_{=1}$.

Suppose that Property (b) is satisfied. We choose $g' = y_1$ (see Equation (3.3)) and distinguish two cases. First, suppose that there exists a subset $E \subsetneq G_0 \setminus \{y_1\}$ such that $y_1 \in \langle E \rangle$. Choose a minimal subset E with this property. By Lemma 3.1.1, there exists an atom A' satisfying the two conditions (C1) and (C2) with $k(A') = 1$ and $v_{y_1}(A') = 1$. Since $v_{y_1}(V_1) = v_{y_1}(UA_1 \cdot \dots \cdot A_{m-1}) + 1$ by Equation 3.4 and $V_1 \mid UA_1 \cdot \dots \cdot A_{m-1} \cdot y_1$, we obtain that $|\text{supp}(UA_1 \cdot \dots \cdot A_{m-1} \cdot A'(V_1)^{-1})| < |G_0|$ and hence $UA_1 \cdot \dots \cdot A_{m-1} \cdot A'$ can be factorized into a product of atoms from $\Omega_{=1}$.

Now we suppose that $y_1 \notin \langle E \rangle$ for any $E \subsetneq G_0 \setminus \{y_1\}$. Let $s_0 \in \mathbb{N}$ be minimal such that there exists a subset $E \subsetneq G_0 \setminus \{y_1\}$ such that $s_0 y_1 \in \langle E \rangle$, and by Lemma 3.3.1, we observe that $s_0 < \text{ord}(g)$. Let E be a minimal subset with this property. Thus, by Lemma 3.1.1, there exists an atom A' with $v_{y_1}(A') = s_0$

satisfying the two conditions (C1) and (C2). Since $\text{supp}(A') \subsetneq G_0$, we have $k(A') = 1$. We distinguish two cases:

CASE 1: $|S_0 \setminus \text{supp}(A')| \geq r + 1$.

Since $s_0 \geq 2$, there is a prime p dividing s_0 . Since by assumption, $y_1 \in \langle G_0 \setminus \{y_1\} \rangle$, Lemma 3.3 implies that for each prime p dividing $\text{ord}(y_1)$, there exists an atom A'_p such that $|\text{supp}(A'_p)| \leq r + 1 < |G_0|$, $1 \leq v_{y_1}(A'_p) \leq \text{ord}(y_1)/2$, and $p \nmid v_{y_1}(A'_p)$.

Let $d = \gcd(s_0, v_{y_1}(A'_p))$. Then $d < s_0$ and $dy_1 \in \langle s_0 y_1, v_{y_1}(A'_p) y_1 \rangle \subset \langle (\text{supp}(A') \cup \text{supp}(A'_p)) \setminus \{y_1\} \rangle$. By the minimality of s_0 , we have $G_0 \setminus \{y_1\} = (\text{supp}(A') \cup \text{supp}(A'_p)) \setminus \{y_1\}$. It follows that

$$\begin{aligned} |\text{supp}(A')| + r &\geq |\text{supp}(A')| + |\text{supp}(A'_p)| - 1 \geq |G_0| \\ &\geq |\text{supp}(A')| + |S_0 \setminus \text{supp}(A')| \geq |\text{supp}(A')| + r + 1, \end{aligned}$$

a contradiction.

CASE 2: $|S_0 \setminus \text{supp}(A')| \leq r$.

Therefore $|\text{supp}(A') \cap S_0| \geq m + 1$ by Equation (3.5), and we may suppose that $\{y_1, \dots, y_{m+1}\} \subset \text{supp}(A') \cap S_0$. Then $V_1 \dots V_{m+1} \mid U A_1 \dots A_{m-1} A'$ and $k(U A_1 \dots A_{m-1} A' (V_1 \dots V_{m+1})^{-1}) < k(U)$. By the minimality of $k(U)$, we have that $U A_1 \dots A_{m-1} A'$ can be factorized into a product of atoms from $\Omega_{=1}$. \square (Proof of **A3**)

A4. Let $g' \in G_0$ and $A' \in \mathcal{A}(G_0)$ with $k(A') = 1$ satisfying the following three conditions:

- (C1) $v_{g'}(A') < \text{ord}(g')$ is the smallest positive integer γ such that $\gamma g' \in \langle \text{supp}(A') \setminus \{g'\} \rangle$;
- (C2) $v_{g'}(A') g' \notin \langle E \rangle$ for any $E \subsetneq \text{supp}(A') \setminus \{g'\}$.
- (C3) $U A_1 \dots A_{m-1} \cdot A'$ can be factorized into a product of atoms from $\Omega_{=1}$.

If $|\text{supp}(A')| \geq m + r + 1$, then there exists an atom $A'' \in \mathcal{A}(G_0)$ with $k(A'') = 1$ and $|\text{supp}(A'')| < |\text{supp}(A')|$ such that (C1), (C2), and (C3) hold.

Suppose that **A4** holds. Iterating **A4** we find an atom A^* with $|\text{supp}(A^*)| \leq m + r$ such that $U A_1 \dots A_{m-1} \cdot A^*$ can be factorized into a product of atoms from $\Omega_{=1}$, a contradiction to (3.5).

Proof of A4. For simplicity of notation, we suppose that $A' = A_m$.

Let $s_0 \in \mathbb{N}$ be minimal such that there exists a subset $E \subsetneq \text{supp}(A_m) \setminus \{g'\}$ such that $s_0 g' \in \langle E \rangle$. By (C1) and $|\text{supp}(A')| \geq m + r + 1 \geq r + 2$, Lemma 3.3 implies that $s_0 < \text{ord}(g')$. Let E be a minimal subset with this property. Thus, by Lemma 3.1.1, there exists an atom A'' with $v_{g'}(A'') = s_0$ satisfying the two conditions (C1) and (C2). Since $\text{supp}(A'') \subsetneq G_0$, we have $k(A'') = 1$. We distinguish two cases:

CASE 1: $|S_0 \setminus \text{supp}(A'')| \geq r + 1$.

We set $s' = v_{g'}(A_m) < \text{ord}(g')$. Since A_m satisfies condition (C1), Lemma 3.1.1 implies that $s' \mid s_0$ and $\frac{s_0}{s'} > 1$. Let p be a prime dividing $\frac{s_0}{s'}$. Since $s' \mid \text{ord}(g')$ and $s_0 \mid \text{ord}(g')$, it follows that $p \mid \frac{s_0}{s'} \mid \frac{\text{ord}(g')}{s'} = \text{ord}(s' g')$. Lemma 3.3 (applied to the subset $\text{supp}(A_m) \subset G$) implies that there exists an atom $A'_p \in \mathcal{A}(\text{supp}(A_m))$ such that $|\text{supp}(A'_p)| \leq r + 1 < |\text{supp}(A_m)|$, $s' \leq v_{g'}(A'_p) \leq \text{ord}(g')/2$, and $p \nmid \frac{v_{g'}(A'_p)}{s'}$.

Let $d = \gcd(\frac{s_0}{s'}, \frac{v_{g'}(A'_p)}{s'})$. Then $d < \frac{s_0}{s'}$ and

$$ds' g' \in \langle s_0 g', v_{g'}(A'_p) g' \rangle \subset \langle (\text{supp}(A'') \cup \text{supp}(A'_p)) \setminus \{g'\} \rangle.$$

Thus by minimality of s_0 , we have $\text{supp}(A_m) \setminus \{g'\} = (\text{supp}(A'') \cup \text{supp}(A'_p)) \setminus \{g'\}$. It follows that

$$\begin{aligned} |\text{supp}(A'')| + r &\geq |\text{supp}(A'')| + |\text{supp}(A'_p)| - 1 \geq |\text{supp}(A_m)| \\ &\geq |\text{supp}(A'')| + |S_0 \setminus \text{supp}(A'')| \geq |\text{supp}(A'')| + r + 1, \end{aligned}$$

a contradiction.

CASE 2: $|S_0 \setminus \text{supp}(A'')| \leq r$.

Therefore $|\text{supp}(A'') \cap S_0| \geq m + 1$ by Equation (3.5), and we may suppose that $\{y_1, \dots, y_{m+1}\} \subset \text{supp}(A'') \cap S_0$. Then $V_1 \cdots V_{m+1} \mid UA_1 \cdots A_{m-1}A''$ and $k(UA_1 \cdots A_{m-1}A''(V_1 \cdots V_{m+1})^{-1}) < k(U)$. By the minimality of $k(U)$, we have that $UA_1 \cdots A_{m-1}A''$ can be factorized into a product of atoms from $\Omega_{=1}$. This completes the proof of (A4) and thus Lemma 3.6 is proved. \square

Proposition 3.7. *We have $m(G) \leq \min\{\frac{n}{2} + r - 2, \max\{r - 1, \frac{5n}{6} - 4, \frac{n+r-3}{2}\}\}$.*

Proof. Let $G_0 \subset G$ be a non-half-factorial LCN set. We have to prove that

$$\min \Delta(G_0) \leq \min\{\frac{n}{2} + r - 2, \max\{r - 1, \frac{5n}{6} - 4, \frac{n+r-3}{2}\}\}.$$

If $G_1 \subset G_0$ is non-half-factorial, then $\min \Delta(G_0) = \gcd \Delta(G_0) \mid \gcd \Delta(G_1) = \min \Delta(G_1)$. Thus we may suppose that G_0 is minimal non-half-factorial. By Lemma 3.1.3.(a), we may suppose that $g \in \langle G_0 \setminus \{g\} \rangle$ for all $g \in G_0$.

If n is a prime power, then $m(G) = r - 1$ by Proposition 2.2, and the assertion follows. Suppose that n is not a prime power. If $|G_0| \leq r + 1$, then $\min \Delta(G_0) \leq |G_0| - 2 \leq r - 1$ by Lemma 3.2.3. Thus we may suppose that $|G_0| \geq r + 2$ and we distinguish two cases.

CASE 1: There exists a subset $G_2 \subset G_0$ such that $\langle G_2 \rangle = \langle G_0 \rangle$ and $|G_2| \leq |G_0| - 2$.

Then Lemma 3.6 implies that $\min \Delta(G_0) \leq \frac{n+r-3}{2}$.

CASE 2: Every subset $G_1 \subset G_0$ with $|G_1| = |G_0| - 1$ is a minimal generating set of $\langle G_0 \rangle$.

Then for each $h \in G_0$, $G_0 \setminus \{h\}$ is half-factorial and $h \notin \langle G_0 \setminus \{h, h'\} \rangle$ for any $h' \in G_0 \setminus \{h\}$. Thus Lemma 3.4 and Lemma 3.6 imply that $\min \Delta(G_0) \leq \max\{\frac{5n}{6} - 4, \frac{n+r-3}{2}\}$. By Lemma 3.4, we obtain that $|G_0| \leq r + \frac{n}{2}$. Therefore Lemma 3.2.3 implies that $\min \Delta(G_0) \leq \min\{r + \frac{n}{2} - 2, \max\{\frac{5n}{6} - 4, \frac{n+r-3}{2}\}\}$. \square

Proposition 3.8. *Let G' be a finite abelian group with $\mathcal{L}(G) = \mathcal{L}(G')$. If $r \in [2, (n-2)/4]$, then $n = \exp(G') > r(G') + 1$.*

Proof. Let $k \in \mathbb{N}$ be maximal such that G has a subgroup isomorphic to C_n^k . Then $k \leq r \leq \frac{n-2}{4} \leq \frac{n-3}{2}$. By Proposition 3.7, we obtain that

$$m(G) \leq \frac{n}{2} + r - 2 \leq n - 2 \leq n - k - 3$$

and hence

$$\max\{m(G), \lfloor \frac{n}{2} \rfloor - 1\} \leq n - k - 3.$$

By Proposition 2.2.3, we have

$$\Delta_1(G) \subset [1, \max\{m(G), \lfloor \frac{n}{2} \rfloor - 1\}] \cup [n - k - 1, n - 2],$$

and thus $n - k - 2 \notin \Delta_1(G)$. Thus $n - k - 2 \notin \Delta_1(G')$ and Proposition 2.2 implies that

$$n - 2 = \max\{m(G), n - 2\} = \max \Delta_1(G) = \max \Delta_1(G') = \max\{r(G') - 1, \exp(G') - 2\}.$$

If $n - 2 = r(G') - 1$, then $\Delta_1(G') = [1, n - 2]$ by Lemma 3.2.2, a contradiction to $n - k - 2 \notin \Delta_1(G')$. Therefore it follows that $n = \exp(G') > r(G') + 1$. \square

4. PROOF OF THE MAIN RESULT AND GROUPS WITH SMALL DAVENPORT CONSTANT

Proof of Theorem 1.1. Let G be an abelian group such that $\mathcal{L}(G) = \mathcal{L}(C_n^r)$ where $r, n \in \mathbb{N}$ with $n \geq 2$, $(n, r) \notin \{(2, 1), (2, 2), (3, 1)\}$, and $r \leq \max\{2, (n+2)/6\}$.

First we note that G has to be finite and that $D(C_n^r) = D(G)$ and $\Delta_1(C_n^r) = \Delta_1(G)$ (see [8, Proposition 7.3.1 and Theorem 7.4.1]). If $r = 1$, then the assertion follows from [8, Theorem 7.3.3]. If $r = 2$, then the assertion follows from [21], and hence we may suppose that $r \in [3, (n+2)/6]$.

Let $k \in \mathbb{N}$ be maximal such that G has a subgroup isomorphic to C_n^k . If $k \geq r$, then $D(C_n^r) = D(G) \geq D(C_n^k)$ implies that $k = r$ and that $G \cong C_n^r$. Suppose that $k < r$. By Proposition 3.8, we obtain that $n = \exp(G) > r(G) + 1$. By Proposition 2.2.3 (applied to C_n^r) we infer that $[n - r - 1, n - 2] \subset \Delta_1(C_n^r) = \Delta_1(G)$. By Proposition 2.2.3 (applied to G), we obtain that

$$[1, r(G) - 1] \cup [n - r - 1, n - 2] \subset \Delta_1(G) \subset [1, \max\{m(G), \lfloor \frac{n}{2} \rfloor - 1\}] \cup [n - k - 1, n - 2],$$

which implies that $m(G) \geq n - r - 1$. By Proposition 3.7, we have that

$$n - r - 1 \leq m(G) \leq \max\left\{r(G) - 1, \frac{5n}{6} - 4, \frac{n + r(G) - 3}{2}\right\}.$$

If $n - r - 1 \leq \frac{5n}{6} - 4$, then $r \geq \frac{n}{6} + 3$, a contradiction. Thus $n - r - 1 \leq \max\{r(G) - 1, \frac{n + r(G) - 3}{2}\}$ which implies that $r(G) \geq n - 2r + 1$. Therefore

$$(4.1) \quad [1, n - 2r] \subset [1, r(G) - 1] \subset \Delta_1(G) = \Delta_1(C_n^r).$$

Since $r \leq \frac{n+2}{6}$, we have that $n - 2r - 1 \geq \frac{n}{2} + r - 2 \geq \lfloor \frac{n}{2} \rfloor - 1$. By Proposition 3.7, we obtain that $m(C_n^r) \leq \frac{n}{2} + r - 2 \leq n - 2r - 1$. Therefore

$$\max\{m(C_n^r), \lfloor \frac{n}{2} \rfloor - 1\} < n - 2r < n - r - 1.$$

By Proposition 2.2.3, $n - 2r \notin \Delta_1(C_n^r)$, a contradiction to Equation (4.1). \square

Our proof of Theorem 1.1, to characterize the groups C_n^r with r, n as above, uses only the Davenport constant and the set of minimal distances. Clearly, there are non-isomorphic groups G and G' with $D(G) = D(G')$, $\Delta^*(G) = \Delta^*(G')$, and $\Delta_1(G) = \Delta_1(G')$. We meet this phenomenon in Proposition 4.1. Indeed, since $\mathcal{L}(C_1) = \mathcal{L}(C_2)$ and $\mathcal{L}(C_3) = \mathcal{L}(C_2 \oplus C_2)$ ([8, Theorem 7.3.2]), small groups definitely deserve a special attention when studying the Characterization Problem. Clearly, the groups C_1, C_2, C_3 , and $C_2 \oplus C_2$ are precisely the groups G with $D(G) \leq 3$. In our final result we show that for all groups G with $D(G) \in [4, 11]$ the answer to the Characterization Problem is positive.

Suppose that $G \cong C_{n_1} \oplus \dots \oplus C_{n_r}$ where $r \in \mathbb{N}_0$ and $1 < n_1 \mid \dots \mid n_r$ and set $D^*(G) = 1 + \sum_{i=1}^r (n_i - 1)$. Then $D^*(G) \leq D(G)$. If $r(G) = r \leq 2$ or if G is a p -group, then equality holds.

Proposition 4.1. *Let G be a finite abelian group with $D(G) \in [4, 11]$. If G' is a finite abelian group with $\mathcal{L}(G) = \mathcal{L}(G')$, then $G \cong G'$.*

Proof. Suppose that G' is a finite abelian group with $\mathcal{L}(G) = \mathcal{L}(G')$. Then $D(G) = D(G')$. If $D(G) \in [4, 10]$, then the assertion follows from [21, Theorem 6.2].

Suppose that $D(G) = D(G') = 11$. If $r(G) \leq 2$ or $r(G') \leq 2$, then the assertion follows from [12, Theorem 1.1]. If G or G' is an elementary 2-group, then the assertion follows from [8, Theorem 7.3.3].

Thus we suppose that $r(G) \geq 3$, $r(G') \geq 3$, $\exp(G) \in [3, 8]$, and $\exp(G') \in [3, 8]$. If $G \cong C_4^3$ or $G' \cong C_4^3$, then the assertion follows from [12, Theorem 4.1]. Thus we may suppose that all this is not the case. Since there is no finite abelian group H with $D(H) = 11$ and $\exp(H) \in \{5, 7\}$, it remains to consider the following groups:

$$C_2^4 \oplus C_4^2, C_2^7 \oplus C_4, C_2^r \oplus C_6, C_2^3 \oplus C_8, C_3^5 \quad \text{for some } r \in \mathbb{N}.$$

By [14, Corollary 2], $D(C_2^r \oplus C_6) = D^*(G) = r + 6$ if and only if $r \leq 3$. Thus $D(C_2^4 \oplus C_6) \geq 11$, and this is the only group for which $D(C_2^r \oplus C_6) = 11$ is possible. Thus we have to consider

$$G_1 = C_2^4 \oplus C_4^2, \quad G_2 = C_2^7 \oplus C_4, \quad G_4 = C_2^4 \oplus C_6, \quad G_5 = C_2^3 \oplus C_8, \quad \text{and} \quad G_6 = C_3^5.$$

Since $\max \Delta^*(G_1) = 5$, $\max \Delta^*(G_2) = 7$, $\max \Delta^*(G_4) = 4$, $\max \Delta^*(G_5) = 6$, and $\max \Delta^*(G_6) = 4$, it remains to show that $\mathcal{L}(C_2^4 \oplus C_6) \neq \mathcal{L}(C_3^5)$. Note that Proposition 2.2 implies that $\Delta^*(C_2^4 \oplus C_6) = [1, 4] = \Delta^*(C_3^5)$. By [8, Theorem 6.6.2], it follows that $\{2, 8\} \in \mathcal{L}(C_2^4 \oplus C_6)$, and we assert that $\{2, 8\} \notin \mathcal{L}(C_3^5)$.

Assume to the contrary that $\{2, 8\} \in \mathcal{L}(C_3^5)$. Then there exists $U, V \in \mathcal{A}(C_3^5)$ such that $L(UV) = \{2, 8\}$. We choose the pair (U, V) such that $|U|$ is maximal and observe that $11 \geq |U| \geq |V| \geq 8$. There exists an element $g \in G$ such that $g|U$ and $-g|V$. Then $v_g(U) \leq 2$ and $v_{-g}(V) \leq 2$. If $v_g(U) = v_{-g}(V) = 2$, then $gV(-g)^{-2}$, $(-g)Ug^{-2}$ and $g(-g)$ are atoms and hence $3 \in L(UV)$, a contradiction. Therefore $v_g(U) + v_{-g}(V) \in [2, 3]$ and we set

$$(4.2) \quad \{g \in \text{supp}(U) \mid v_g(U) + v_{-g}(V) = 3\} = \{g_1, \dots, g_\ell\} \quad \text{where} \quad \ell \in \mathbb{N}_0.$$

We continue with the following assertion.

A1. For each $i \in [1, \ell]$ we have $v_{g_i}(U) = 2$.

Proof of A1. Assume to the contrary that there is an $i \in [1, \ell]$ with $v_{g_i}(U) = 1$. Then $g_i V((-g_i)^2)^{-1}$ is an atom and $(-g_i)^2 U g_i^{-1}$ is an atom or a product of two atoms. Since $3 \notin L(UV)$, we obtain that $(-g_i)^2 U g_i^{-1}$ is an atom but $|(-g_i)^2 U g_i^{-1}| > |U|$, a contradiction to our choice of $|U|$. \square (Proof of **A1**)

Now we set

$$U' = (-g_1) \cdots (-g_\ell) U (g_1^2 \cdots g_\ell^2)^{-1} \quad \text{and} \quad V' = g_1^2 \cdots g_\ell^2 V ((-g_1) \cdots (-g_\ell))^{-1}.$$

Using the above argument repeatedly we infer that U' and V' are atoms. Clearly, we have $L(U'V') = L(UV) = \{2, 8\}$ whence $|V| + \ell = |V'| \leq |U|$ and thus $\ell \leq 3$. We consider a factorization

$$UV = W_1 \cdots W_8,$$

where $W_1, \dots, W_8 \in \mathcal{A}(C_3^5)$ such that $|\{i \in [1, 8] \mid |W_i| = 2\}|$ is maximal under all factorization of UV of length 8. We set $U = U_1 \cdots U_8$, $V = V_1 \cdots V_8$ such that $W_i = U_i V_i$ for each $i \in [1, 8]$, and we define $W = \sigma(U_1) \cdots \sigma(U_8)$. We continue with a second assertion.

A2. There exist disjoint non-empty subsets $I, J, K \subset [1, 8]$ such that

$$I \cup J \cup K = [1, 8] \quad \text{and} \quad \sigma\left(\prod_{i \in I} U_i\right) = \sigma\left(\prod_{j \in J} U_j\right) = \sigma\left(\prod_{k \in K} U_k\right).$$

Proof of A2. First we suppose that $h(W) \geq 2$, say $\sigma(U_1) = \sigma(U_2)$. Then $I = \{1\}$, $J = \{2\}$, and $K = [3, 8]$ have the required properties. Now suppose that $h(W) = 1$. Since the tuple $(\sigma(U_1), \dots, \sigma(U_7))$ is not independent and the sequence $\sigma(U_1) \cdots \sigma(U_7)$ is zero-sum free, there exist disjoint non-empty subset $I, J \subset [1, 8]$, such that $\sum_{i \in I} \sigma(U_i) = \sum_{j \in J} \sigma(U_j)$. Therefore, I, J , and $K = [1, 8] \setminus (I \cup J)$ have the required properties. \square (Proof of **A2**)

We define

$$X_1 = \prod_{i \in I} U_i, \quad X_2 = \prod_{j \in J} U_j, \quad \text{and} \quad X_3 = \prod_{k \in K} U_k,$$

$$Y_1 = \prod_{i \in I} V_i, \quad Y_2 = \prod_{j \in J} V_j, \quad \text{and} \quad Y_3 = \prod_{k \in K} V_k.$$

By construction, we have $X_1 Y_1 = \prod_{i \in I} W_i$, $X_2 Y_2 = \prod_{j \in J} W_j$, $X_3 Y_3 = \prod_{k \in K} W_k$, $\sigma(X_1) = \sigma(X_2) = \sigma(X_3)$, $\sigma(Y_1) = \sigma(Y_2) = \sigma(Y_3)$, and hence $X_i Y_j \in \mathcal{B}(G)$ for all $i, j \in [1, 3]$.

We choose a factorization of $X_1 Y_2$, a factorization of $X_2 Y_3$, and a factorization of $X_3 Y_1$, and their product gives rise to a factorization of UV , say $UV = W'_1 \cdots W'_8$, where all the W'_i are atoms, and we denote by t_1 the number of W'_i having length two. Similarly, we choose a factorization of $X_1 Y_3$, a factorization of $X_2 Y_1$, and a factorization of $X_3 Y_2$, obtain a factorization of UV , and we denote by t_2 the number of atoms of length 2 in this factorization. If $g \in G$ and $i, j \in [1, 3]$ are distinct with

$g(-g) \mid X_i Y_j$ and $g \mid X_i$, then the choice of the factorization $UV = W_1 \cdot \dots \cdot W_8$ implies that $g(-g) \mid X_i Y_i$ or $g(-g) \mid X_j Y_j$ whence $v_g(U) + v_{-g}(V) \geq 3$. Therefore Equation (4.2) implies that $g \in \{g_1, \dots, g_\ell\}$ whence $t_1 + t_2 \leq \ell \leq 3$, and we may suppose that $t_1 \leq 1$. Therefore we infer that

$$2 + 3 \times 7 \leq \sum_{i=1}^8 |W'_i| = |UV| \leq 2D(C_3^5) = 22,$$

a contradiction. □
